ANISTRIKE

Anti-Tick & Flea Spray

As ANISTRIKE uses new generation insecticide, Insect Growth Regulator (IGR) provides you with a new approach to tick and flea control. ANISTRIKE stops ticks and fleas propagation and it's safe for you & your pets. Thus, no more problems with pests FOREVER!

What is Insect Growth Regulator (IGR)?

IGR affects the physiology of morphogenesis, reproduction and embryogenesis of insects. The morphogenetic effect of IGR is primarily seen during larval-pupal or nymphal-adult transformation. Under the presence of IGR, various degrees of incomplete metamorphosis can be seen.

Due to such unique modes of action, IGR prevents successful growth of insect population.

What happens with the application of Insect Growth Regulator (IGR)?

Against tick, flea and other insects, IGR inhibits their life cycles at the pupal stages. Where applied, larvae develop normally to pupation, but they cannot become adults. That is, normal maturing into an adult capable of reproduction is inhibited. Thus, the target population gradually decreases.
